The ControlLogix® Architecture provides a wide range of input and output modules to span many applications, from high-speed digital to process control. The ControlLogix architecture uses Producer/Consumer technology, which allows input information and output status to be shared among multiple ControlLogix controllers.

## Summary of Changes

This publication contains new and updated information as indicated in the following table.

Topic	Page
Corrected 1756-0F8H, 1756-0F8HK Technical Specifications	233
Corrected RTB Specifications	270

Rockwell Automation recognizes that some of the terms that are currently used in our industry and in this publication are not in alignment with the movement toward inclusive language in technology. We are proactively collaborating with industry peers to find alternatives to such terms and making changes to our products and content. Please excuse the use of such terms in our content while we implement these changes.

Bulletin 1756 ControlLogix chassis-based modules provide a full range of digital, diagnostic digital, analog, motion control, specialty I/O, and compute modules to meet your application needs. You can use any of the chassis-based modules in the local chassis of a ControlLogix controller or in a chassis linked to a ControlLogix controller across ControlNet<sup>®</sup> or EtherNet/IP<sup>™</sup> networks.

## Catalog Number Explanation

Certain I/O module catalog numbers contain characters at the **end** of the catalog number that indicate additional features.

Character	I/O Type	Description
D	Diagnostic	These modules provide diagnostic features to the point level.
E	Electronic fusing	These modules have internal electronic fusing to help prevent too much current from flowing through the module.
I	Individually isolated	These modules have individually isolated inputs or outputs.
K	Conformal coated	These modules have additional conformal coating and design considerations that add a degree of protection when exposed to harsh, corrosive environments.
XT	Conformal coated	These modules have additional conformal coating and design considerations that add a greater degree of protection when exposed to harsh, corrosive environments.
H	HART interface	These modules send and receive digital information across analog wires between smart devices and control or monitoring systems data using HART (Highway Addressable Remote Transducer) protocol.
S	Scheduled or Safety	These modules offer time-scheduled output control or ensure that ControlLogix control systems operate safely.
SOE	Sequence of Events	These modules offer sub-millisecond time-stamping on a per point basis.

### IMPORTANT

When a ControlLogix product that is rated for harsh environments (corrosive atmosphere, extended temperature, etc.) is used in a system with other ControlLogix products that have lower specification values, the system is derated to the lowest common value.

**EXAMPLE:** If the maximum operating temperature specification found in the Technical Data for your ControlLogix-XT module is 70 °C (158 °F) and you pair it with a ControlLogix chassis that is temperature rated to 60 °C (140 °F), your system is derated to 60 °C (140 °F).

To ensure that your system is equipped for harsh environments, compare the corrosive atmosphere, temperature, and other specifications found in the Technical Data publication for each product.

# ControlLogix I/O Module Accessories

## Chassis and Power Supply

1756 ControlLogix I/O modules must be mounted in a ControlLogix chassis and each chassis requires a power supply. For more information about the 1756 Chassis and Power Supply options available for your system, see [page 269](#).

## Standard I/O Module Wiring

1756 ControlLogix standard I/O modules require either a Removable Terminal Block (RTB) or a 1492 interface module (IFM) to connect all field-side wiring. RTBs and IFMs are not included with the I/O modules. They must be ordered separately. For more information about the RTBs and IFMs available for your system, see [page 269](#) and [page 271](#).

## Safety I/O Module Wiring

1756 ControlLogix safety I/O modules require either a specific Removable Terminal Block (RTB) or 1492 interface module (IFM) to connect all field-side wiring.

- 1756-IB16S (1756 ControlLogix 16-point Sinking Safety Input Module) has been agency certified using only the ControlLogix RTBs (1756-TBCHS, 1756-TBS6HS).
- 1756-OBV8S (ControlLogix 8-point Safety Bipolar/Sourcing Output Module) has been agency certified using only the ControlLogix RTBs (1756-TBNHS, 1756-TBSHS).
- For information about the IFM module wiring systems that have been tested for use with 1756 Safety I/O modules, see Knowledgebase Technote, [1492 IFM Modules, Cables and Wiring Diagrams for 1756-IB16S, 1756-OBV8S Safety I/O Modules](#).

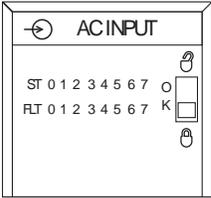

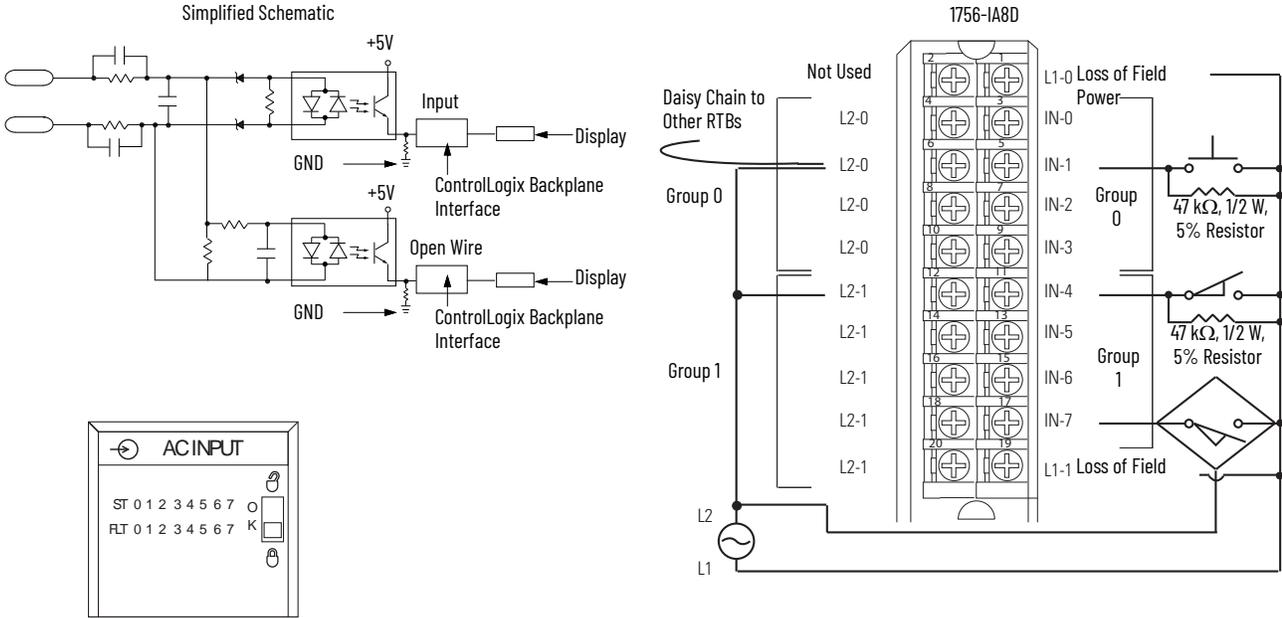

RTBs and IFMs are not included with the I/O modules. They must be ordered separately. For more information about the RTBs and IFMs available for your system, see [page 269](#) and [page 271](#).

Any application that requires agency certification of the ControlLogix system by using other wiring termination methods may require application-specific approval by the certifying agency.

(1) UL certification for 120/240V 50/60 Hz nominal. Rockwell Automation specified to 74...265, 47...63 Hz.

(2) The commutating dv/dt of the output voltage (OUTPUT to L2) should not exceed 0.2V/μs for loads under 50 mA. The commutating dv/dt rating of the module for loads 50...500 mA (OUTPUT to L2) is 4V/μs maximum. If the commutating dv/dt rating of the TRIAC is exceeded, the TRIAC could latch on. If the commutating dv/dt rating is exceeded in the 10...50 mA range, a resistor can be added across the output and L2. The purpose of this resistor is to increase the total output current to 50 mA (I=V/R). At 50 mA and above, the module has a higher commutating dv/dt rating. When adding a resistor for the output to L2, be sure it is rated for the power that it dissipates (P=(V\*\*2)/R). If the commutating dv/dt rating is exceeded in the 50...500 mA range, the L1 AC waveform could be at fault. Be sure that the waveform is a good sinusoid, void of any anomalies such as distorted, or flattened sections.

(1) UL certification for 120/240V 50/60 Hz nominal. Rockwell Automation specified to 74...265V, 47...63 Hz.

(2) The commutating dv/dt of the output voltage (OUTPUT to L2) should not exceed 0.2V/μs for loads under 50 mA. The commutating dv/dt rating of the module for loads 50...500 mA (OUTPUT to L2) is 4V/μs maximum. If the commutating dv/dt rating of the TRIAC is exceeded, the TRIAC could latch on. If the commutating dv/dt rating is exceeded in the 10...50 mA range, a resistor can be added AC across the output and L2. The purpose of this resistor is to increase the total output current to 50 mA (I=V/R). At 50 mA and above, the module has a higher commutating dv/dt rating. When adding a resistor for the output to L2, be sure it is rated for the power that it dissipates (P=(V\*\*2)/R). If the commutating dv/dt rating is exceeded in the 50...500 mA range, the L1 AC waveform could be at fault. Be sure that the waveform is a good sinusoid, void of any anomalies such as distorted, or flattened sections.

(2) The commutating dv/dt of the output voltage (OUTPUT to L2) should not exceed 0.2V/μs for loads under 50 mA. The commutating dv/dt rating of the module for loads 50...500 mA (OUTPUT to L2) is 4V/μs maximum. If the commutating dv/dt rating of the TRIAC is exceeded, the TRIAC could latch on. If the commutating dv/dt rating is exceeded in the 10...50 mA range, a resistor can be added AC across the output and L2. The purpose of this resistor is to increase the total output current to 50 mA ( $i=V/R$ ). At 50 mA and above, the module has a higher commutating dv/dt rating. When adding a resistor for the output to L2, be sure it is rated for the power that it dissipates ( $P=(V^2)/R$ ). If the commutating dv/dt rating is exceeded in the 50...500 mA range, the L1 AC waveform could be at fault. Be sure that the waveform is a good sinusoid, void of any anomalies such as distorted, or flattened sections.

(3) Use this conductor category information for planning conductor routing as described in the system-level installation manual. See the Industrial Automation Wiring and Grounding Guidelines, publication [1770-4.1](#).

**Notes:**

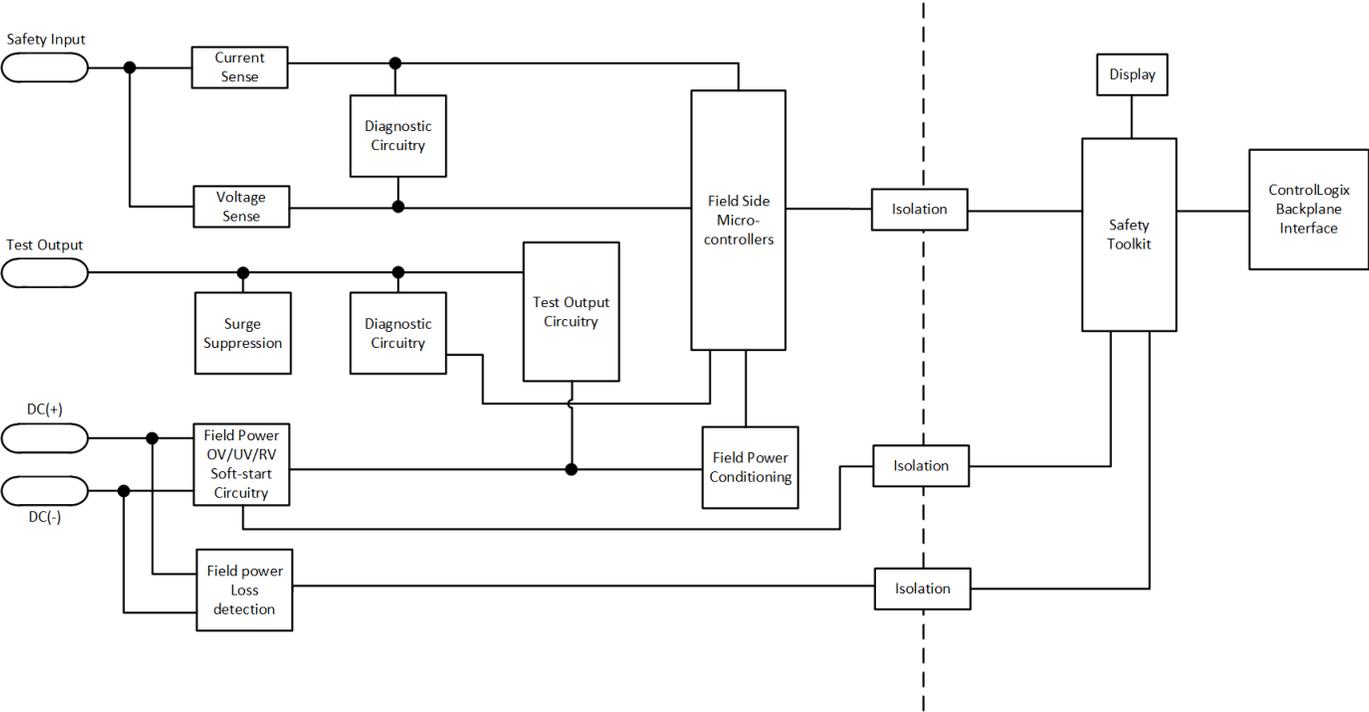

# 1756-IB16S

ControlLogix DC (18...32V) sinking safety input module.

You must connect a 24V DC SELV/PELV power source to the DC+/- terminals to provide field-side power.

- IMPORTANT**
- The 24V (DC+ and DC-) power connections are used to supply field-side power to the module.
  - All terminals with the same name are connected together on the module. For example, DC+ can be connected to either terminal marked DC +.
  - Do not physically connect more than two wires to a single RTB terminal.
  - All other I/O modules in the same chassis must use an SELV/PELV power supply.
  - The 1756-IB16S module is compatible with a series C ControlLogix chassis.
  - Do not install the module in a series B ControlLogix chassis.

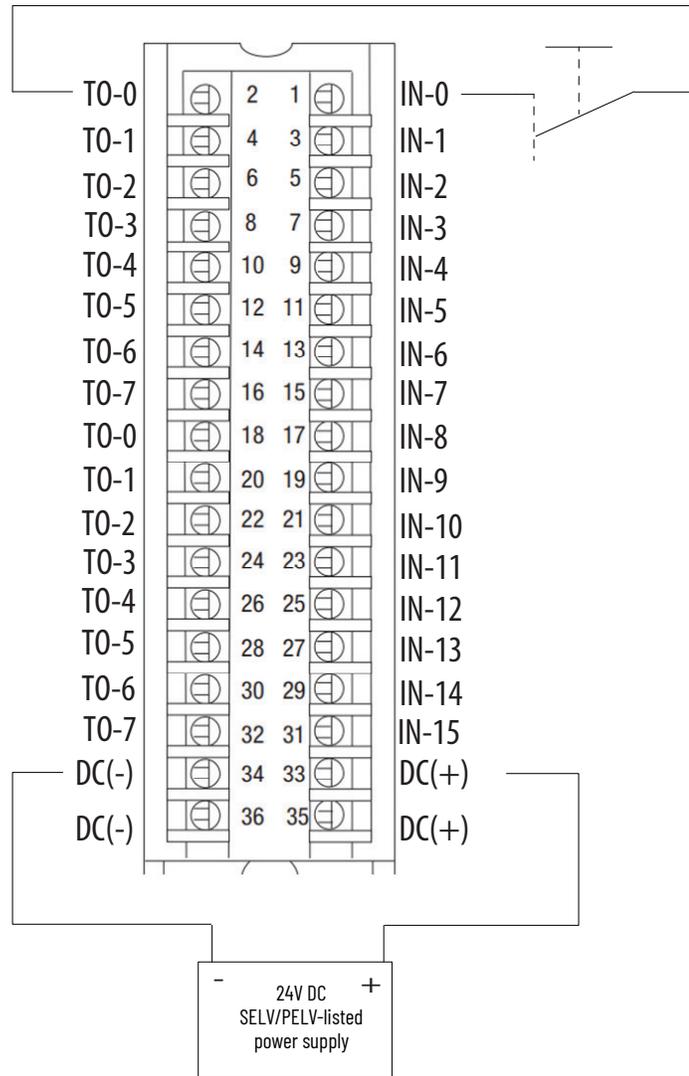

1756-IB16S Simplified Schematic

When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 2** and **PLd** as defined in ISO 13849-1. To achieve that suitability rating, you may have to perform diagnostic testing of the safety function.

One diagnostic test method is to configure the safety input channel for Safety Pulse Test to test the circuit for short circuits to 24V DC.

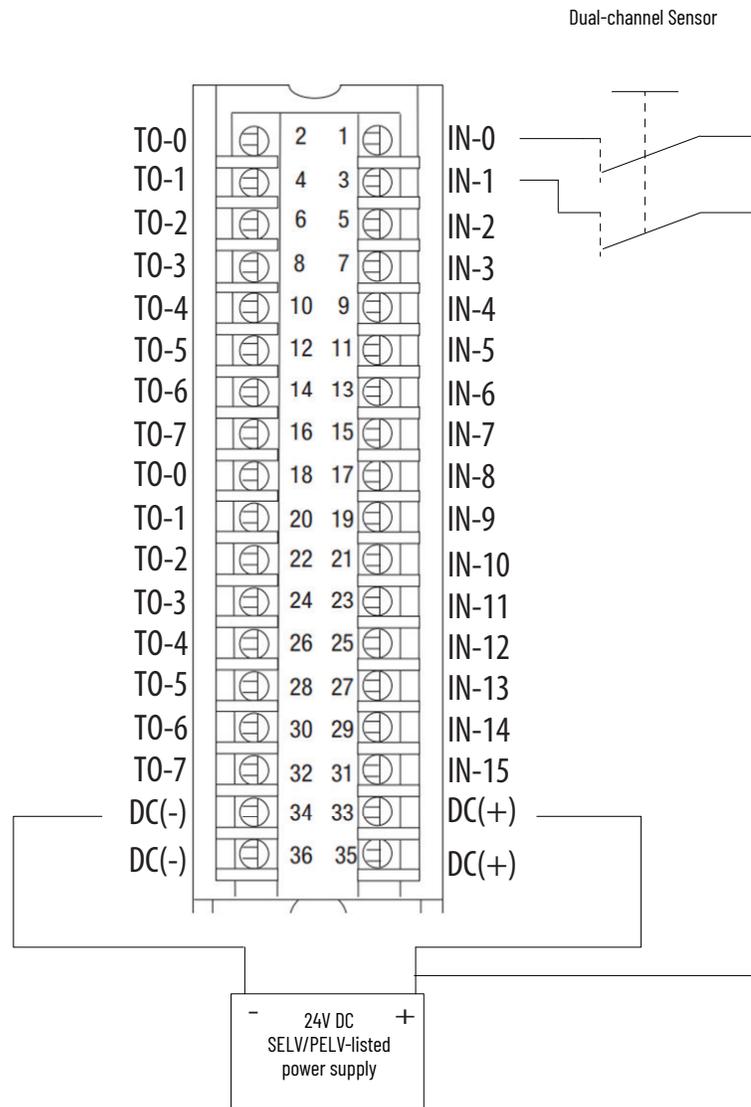

**Channel Connections**  
 The diagram shows devices that are connected to safety input channel 0 and test output channel 0. You can connect devices to all 16 channels.

When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 3** and **PLd** as defined in ISO 13849-1.

**IMPORTANT** Switches are suitable for applications that are rated up to, and including SIL 3 CL3, PLd, Cat 3.

**Channel Connections**  
 This diagram shows devices that are connected to safety input channels 0 and 1.  
 You can connect devices to all 16 channels.

When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 4** and **PLe** as defined in ISO 13849-1. To achieve that suitability rating, you may have to perform diagnostic testing of the safety function.

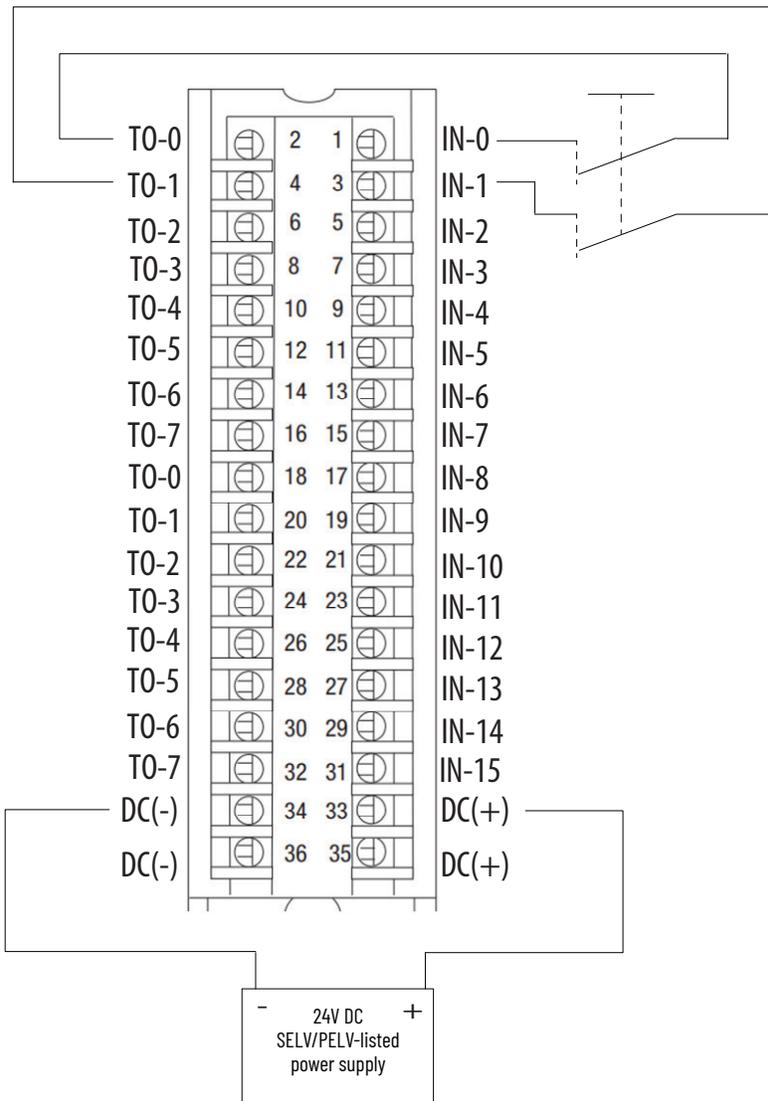

One diagnostic test method is to configure the safety input channel for Safety Pulse Test to test the circuit for short circuits to 24V DC. Safety input pairs must be associated with different Test Output sources.

**Channel Connections**

This diagram shows devices that are connected to safety input channels 0 and 1; and to test outputs 0 and 1.

You can connect devices to all 16 channels.

Because of the pre-configured relationships between test outputs and input channels, wiring a dual channel device to input channels 0 and 8 is not supported if pulse testing is required, the same holds true for 1/9, 2/10, 3/11, 4/12, 5/13, 6/14, 7/15.

# 1756-OBV8S

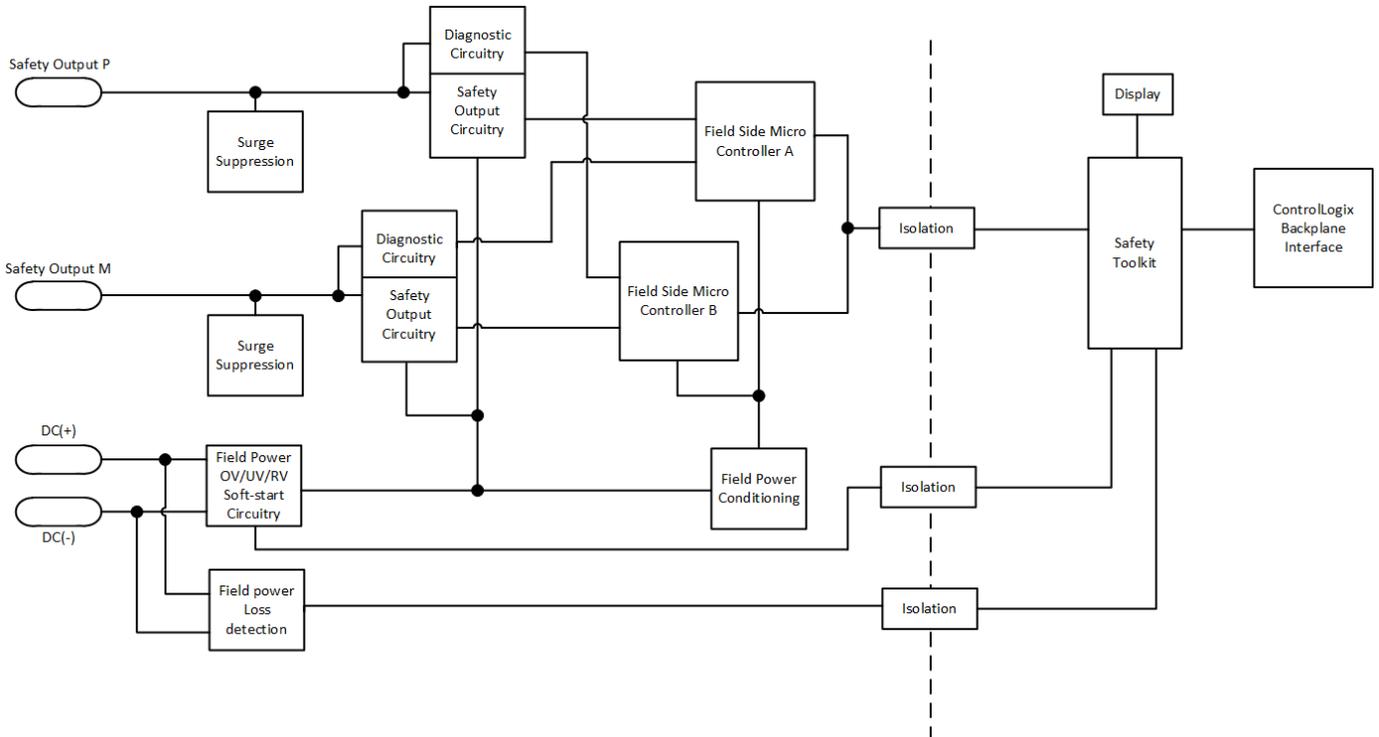

ControlLogix DC (18...32V) safety bipolar/sourcing output module

You can use the 1756-OBV8S module in Bipolar mode or Sourcing mode.

- IMPORTANT**
- The 24V (DC+ and DC-) power connections are used to supply field-side power to the module.
  - All terminals with the same name are connected together on the module. For example, DC+ can be connected to either terminal marked DC +.
  - Do not physically connect more than two wires to one RTB terminal.
  - All other I/O modules in the same chassis must use an SELV/PELV power supply.
  - The 1756-OBV8S module is compatible with a series C ControlLogix chassis.
  - Do not install the output module in a series B ControlLogix chassis.
  - Because of the higher internal power dissipation of the output module, do not install a 1756-OBV8S module next to any controller or communication module.

## 1756-OBV8S Simplified Schematic

This schematic represents EVEN channels. ODD channels would reverse which micro controller controls P and M.

### Bipolar Mode

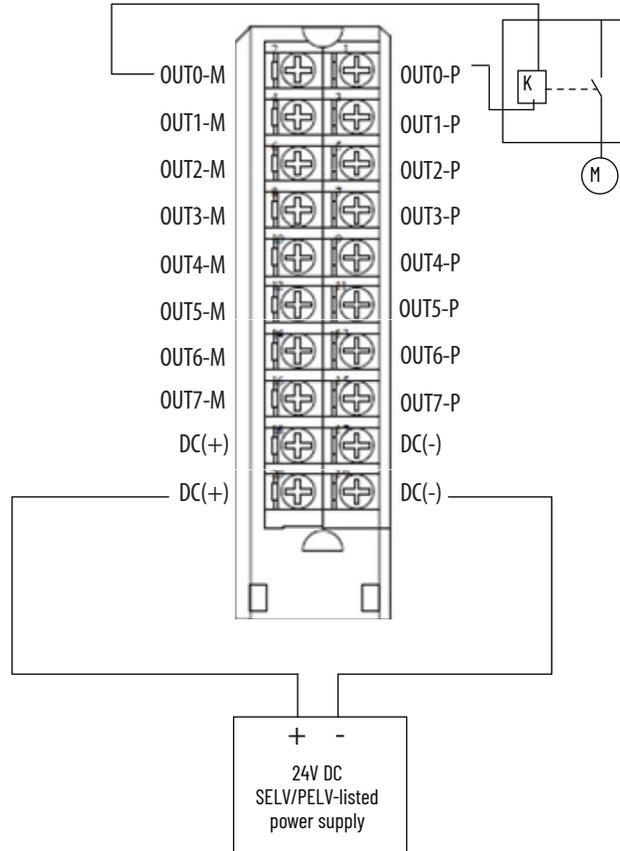

When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 2** and **PLd** as defined in ISO 13849-1.

To achieve that suitability rating, you may have to perform diagnostic testing and monitoring of the safety function. One diagnostic test method is to configure the safety output channel for Safety Pulse Test to test the circuit for short circuits to 24V DC.

#### Channel Connections

This wiring example shows connections to Safety Output 0. You are not limited to using channel 0 in this mode. You can use all channels as determined by your application.

We **strongly recommend** that, if you have a direct connection between the safety output module and an input module and those modules are powered by separate power supplies, you connect module DC- and actuator DC- together. This practice helps to eliminate grounding float from disrupting diagnostics.

When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 4** and **PLe** as defined in ISO 13849-1.

To achieve that suitability rating, you may have to perform diagnostic testing and monitoring of the safety function. One diagnostic test method is to configure the safety output channel for Safety Pulse Test to test the circuit for short circuits to 24V DC.

The application is configured so that a No Load fault can only be detected if the wires from **both** the P- terminal and the M-terminal are disconnected.

For Cat.4 applications, if your application remains in safe state, that is, the output is off, for a prolonged duration, we recommend that you take one of these actions:

- Apply output monitoring at the actuator. The monitoring can be direct or indirect.
- Limit the safe state to no more than 24 hours.
- Conduct functional test if safe state dwell time increases.

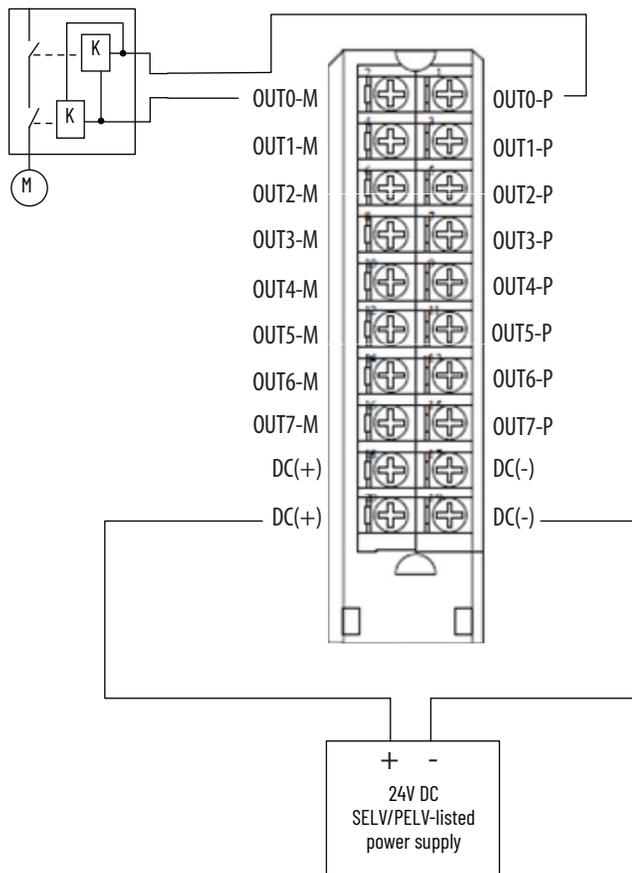

**Connection Pairs**

The terminals for each channel function as a Bipolar connection pair when you use a 1756-OBV8S module in Bipolar switching mode. For example, the Safety Output 0 P (Sourcing) terminal and Safety Output 0 M (Sinking) terminal are a Bipolar connection pair. That is, they are a P-M pair. When the module is in Bipolar switching mode, you must connect the device to both terminals.

**Channel Connections**

This wiring example shows connections to the P-M pair for Safety Output 0. You are not limited to using channel 0 in this mode. You can use all channel pairs as determined by your application.

We **strongly recommend** that, if you have a direct connection between the safety output module and an input module and those modules are powered by separate power supplies, you connect the DC- terminals together. This practice helps to eliminate grounding float from disrupting diagnostics.

To achieve that suitability rating, you may have to perform diagnostic testing and monitoring of the safety function. One diagnostic test method is to configure the safety output channel for Safety Pulse Test to test the circuit for short circuits to 24V DC.

- We **strongly recommend** that you connect separate shielded cables to the P terminal and the M terminal to reduce possibility of a short between these terminals. If a short is detected across the P-M pair, the module outputs are turned off, but the actuator that is connected to the output pair remains on.
- No Load and Overload conditions are only detectable at the P terminal.

For Cat.4 applications, if your application remains in safe state, that is, the output is off, for a prolonged duration, we recommend that you take one of these actions:

- Apply output monitoring at the actuator. The monitoring can be direct or indirect.
- Limit the safe state to no more than 24 hours.
- Conduct functional test if safe state dwell time increases.

**Actuator DC Power**

In this wiring configuration, you must connect the **DC+ terminal to an SELV/PELV-listed** power supply. The DC+ and DC- on the actuator must be connected to the same power supply as the DC+ and DC- on the module.

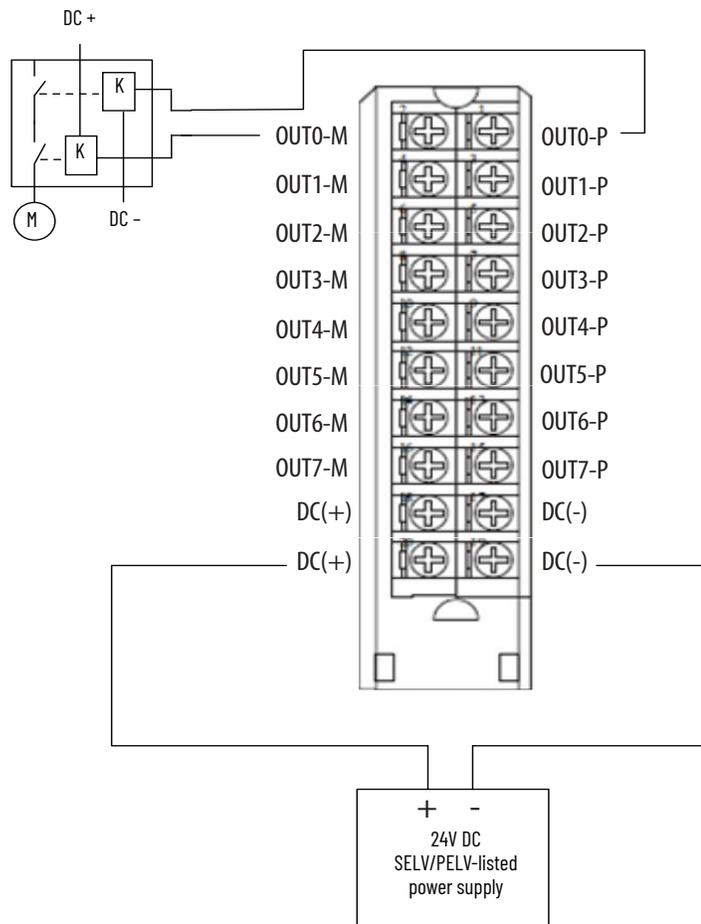

**Connection Pairs**

The terminals for each channel function as a Bipolar connection pair when you use a 1756-0BV8S module in Bipolar switching mode. For example, the Safety Output 0 P (Sourcing) terminal and Safety Output 0 M (Sinking) terminal are a Bipolar connection pair. That is, they are a P-M pair. When the module is in Bipolar switching mode, you must connect the device to both terminals.

**Channel Connections**

This wiring example shows connections to the P-M pair for Safety Output 0. You are not limited to using channel 0 in this mode. You can use all channel pairs as determined by your application.

We **strongly recommend** that, if you have a direct connection between the safety output module and an input module and those modules are powered by separate power supplies, you connect the DC- terminals together. This practice helps to eliminate grounding float from disrupting diagnostics.

### Sourcing Mode

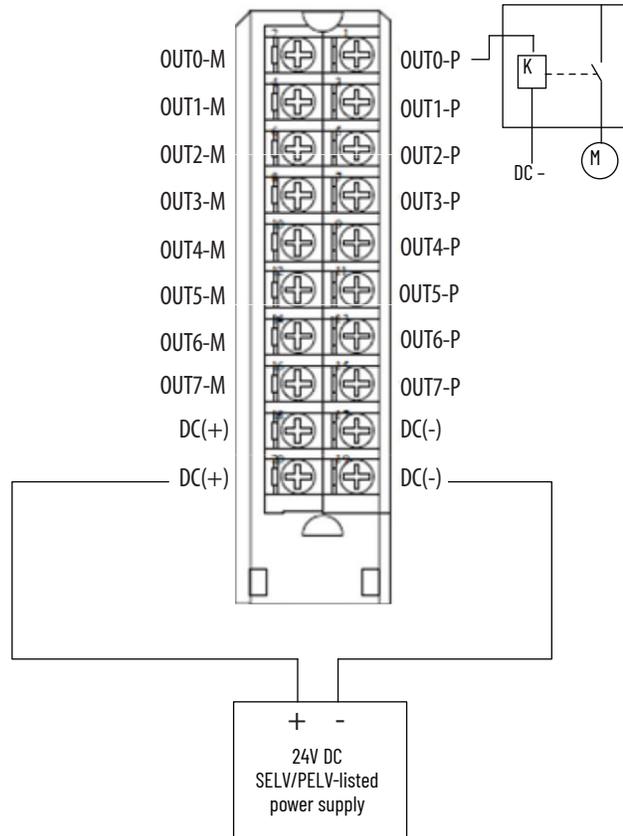

When the module is wired as shown, it is suitable for applications that are rated up to, and including, **Category 2** and **PLd** as defined in ISO 13849-1.

To achieve that suitability rating, you may have to perform diagnostic testing and monitoring of the safety function. One diagnostic test method is to configure the safety output channel for Safety Pulse Test to test the circuit for short circuits to 24V DC.

- Conduct functional test if safe state dwell time increases.

**Connection Pairs**

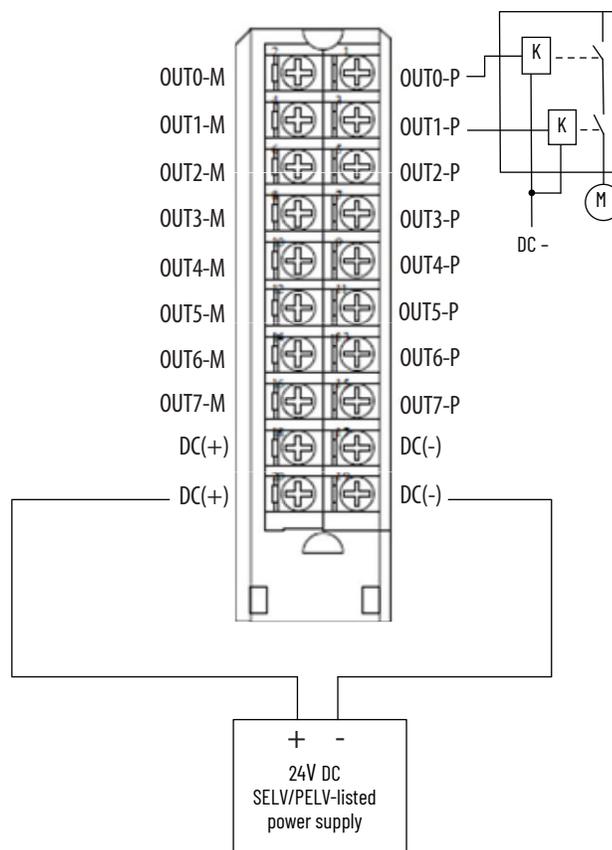

When you use dual-channel sourcing wiring on the 1756-0BV8S module, you must connect the devices to dual-channel connection pairs. For example, the devices are connected to channels 4 and 5 because they are a connection pair. These channels are dual-channel connection pairs:

- Channels 0 and 1 (shown)
- Channels 2 and 3
- Channels 4 and 5
- Channels 6 and 7

**Channel Connections**

This wiring example shows connections to Safety Output 0 P and Safety Output 1P. You are not limited to using channels 0 and 1 in this mode. You can use all channel pairs as determined by your application.

We **strongly recommend** that, if you have a direct connection between the safety output module and an input module and those modules are powered by separate power supplies, you connect module DC- and actuator DC- together. ## ControlLogix current/voltage analog input module

Use this table when wiring your module in Differential Current mode.

This Channel	Uses these terminals
Channel 0	IN-0 (+), IN-1 (-), i RTN-0
Channel 1	IN-2 (+), IN-3 (-), i RTN-2
Channel 2	IN-4 (+), IN-5 (-), i RTN-4
Channel 3	IN-6 (+), IN-7 (-), i RTN-6

- All terminals marked RTN are connected internally.
- A 249 Ω current loop resistor is located between IN-x and i RTN-x terminals.
- If multiple (+) or multiple (-) terminals are tied together, connect that tie point to an RTN terminal to maintain the module accuracy.
- Place additional loop devices (such as strip chart recorders) at the A location in the current loop.

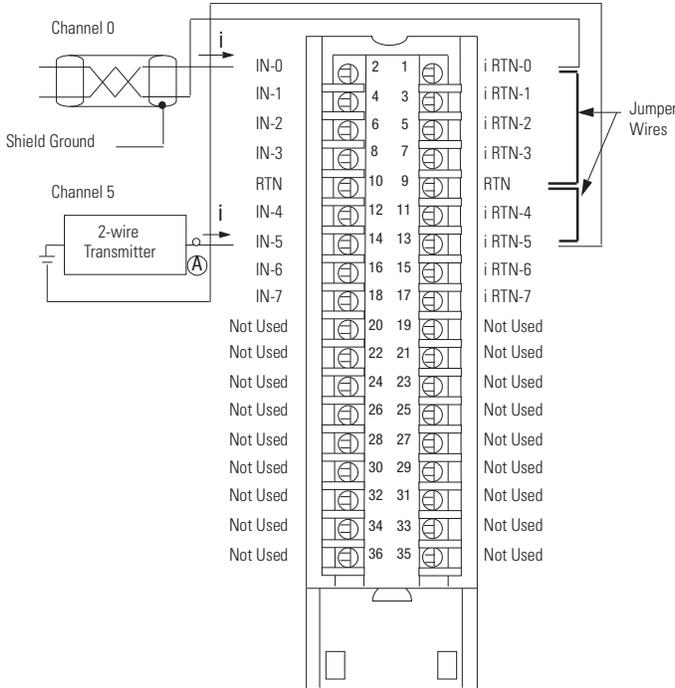

**IMPORTANT:** When operating in 2-channel, High-Speed mode, only use channels 0 and 2.

- CJC sensors are only required with use of the Thermocouple input type and when channel wiring is connected via an RTB.
- CJC sensors are not needed when using IFM as it has built-in CJC sensor.
- You cannot use CJC and connect a CJC sensor to only one channel.

- CJC sensors do not come with the module. You must order the sensors, product catalog number 1756-CJC, separately.
- If separate power sources are used, do not exceed the specific isolation voltage as listed in the specifications.
- CJC sensors are only required when channel wiring is connected via an RTB.
- CJC sensors are not needed when using IFM as it has built-in CJC sensor.
- You cannot use CJC and connect a CJC sensor to only one channel.

# 1756-CFM, 1756-CFMK

ControlLogix configurable flowmeter module

**1756-CFM Standard Magnetic Pickup**

**1756-CFM Standard Output**

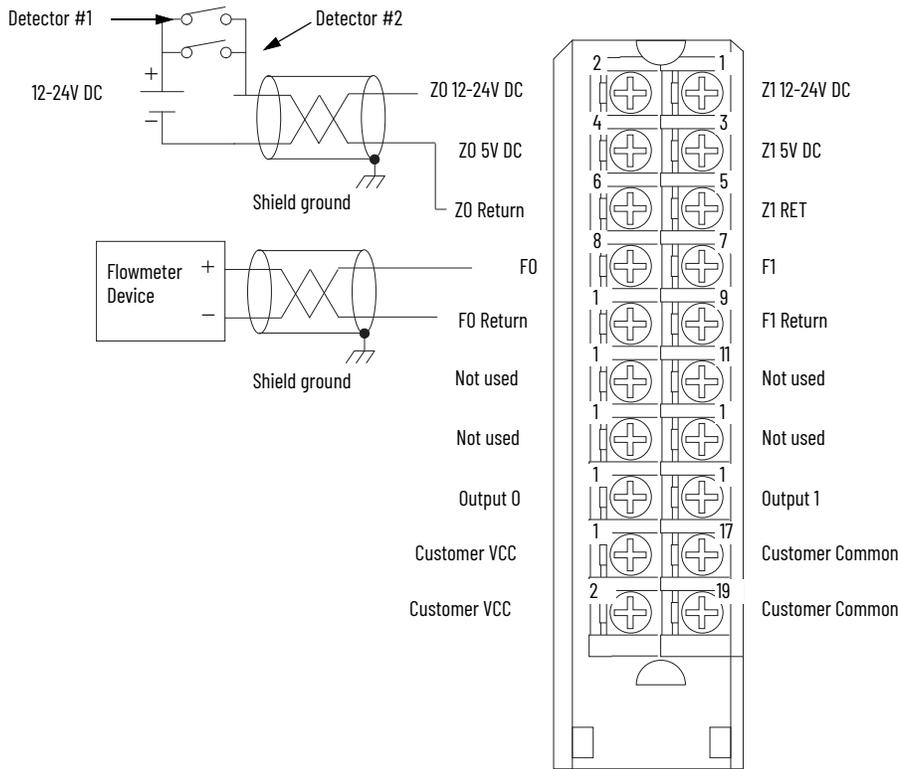

1. This wiring diagram can be used in applications with 50 mV (magnetic pickup), 1.3V (TTL), or 4V (preamp level) thresholds. You must use the Studio 5000 Logix Designer® application to choose the appropriate threshold level for your specific application.
2. If separate power sources are used, do not exceed the specified isolation voltage.

If separate power sources are used, do not exceed the specified isolation voltage.

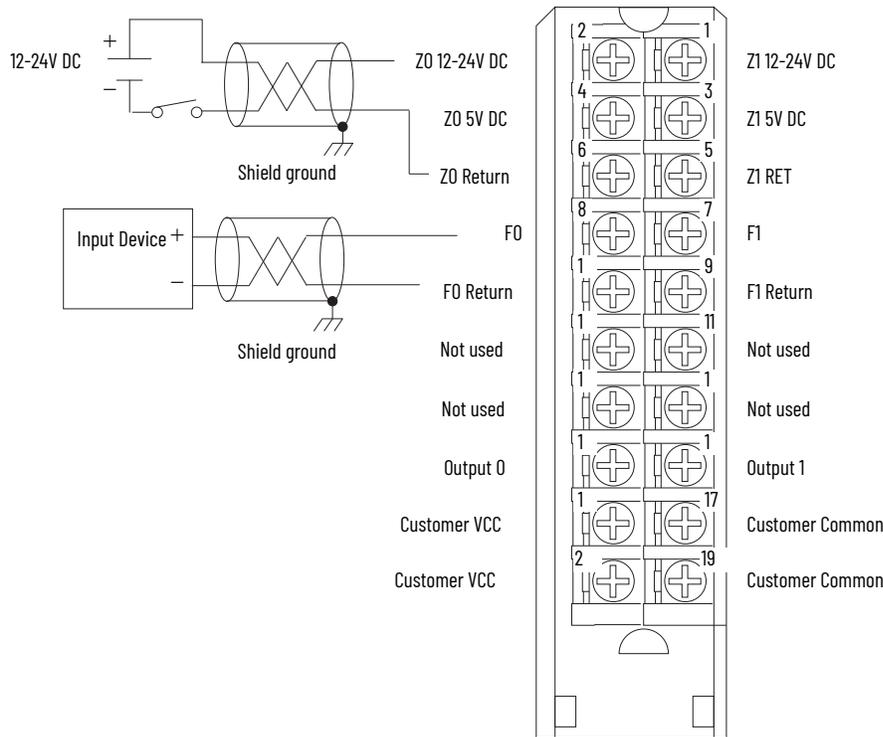

The 1756-CFM and 1756-CFMK modules provide Totalizer mode for metering applications, or high-speed frequency measurements for speed or rate control applications, on two channels connected to flowmeters.

1756-CFM Standard Prover/Detector Example 1

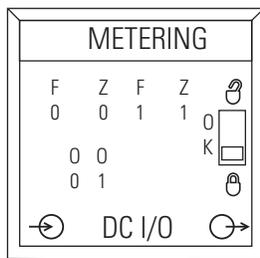

- Detectors #1 and #2 must be wired in parallel.
- Customer VCC can be used to power detectors. In this case, though, the maximum current on the wiring arm must be less than 4 A.
- The wiring example above shows a 12-24V DC standard prover connected to the module.
- If you use a 5V DC standard prover, make sure the positive wire is connected to the 5V terminal (for example, Z0 5V DC).
- If separate power sources are used, do not exceed the specified isolation voltage.

**1756-CFM Standard Prover/Detector Example 2**

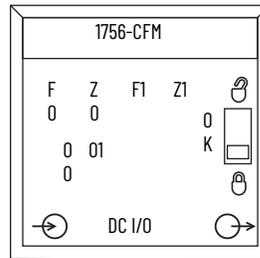

- Customer VCC can be used to power detectors. In this case, though, the maximum current on the wiring arm must be less than 4 A.
- The wiring example above shows a 12-24V DC standard prover connected to the module.
- If you use a 5V DC standard prover, make sure the positive wire is connected to the 5V terminal (for example, Z0 5V DC).
- If separate power sources are used, do not exceed the specified isolation voltage.

ControlLogix 10...30V low-speed counter module

Simplified Schematic

This diagram shows how to wire a proximity sensor to the module's eight counters or eight hardware inputs. Counters use incoming pulses for counts and frequency with two user-configurable On/Off windows per counter. Hardware inputs provide standard input or counter-control functionality.

# 1756 Removable Terminal Blocks

Removable terminal blocks (RTBs) provide a flexible interconnection between your plant wiring and 1756 ControlLogix I/O modules. The RTB plugs into the front of the I/O module. The type of module determines which RTB you need. You can choose screw-clamp or spring-clamp RTBs.

RTBs are not shipped with I/O modules. You must order them separately. The standard housing on the front of the wiring arm is not deep enough for 2.5 mm<sup>2</sup> (14 AWG) wiring. So, if you plan to use 2.5 mm<sup>2</sup> (14 AWG) wiring, order the extended housing.

**ATTENTION:** If separate power sources are used, do not exceed the specified isolation voltage. See the specifications for each individual module on the preceding pages.

**WARNING:** Do not use 1756-TBNHS, 1756-TBSHS, 1756-TBCHS, or 1756-TBS6HS safety RTBs and 1756-TBES extended-depth terminal block housings with non-safety I/O modules.

# Wiring Systems

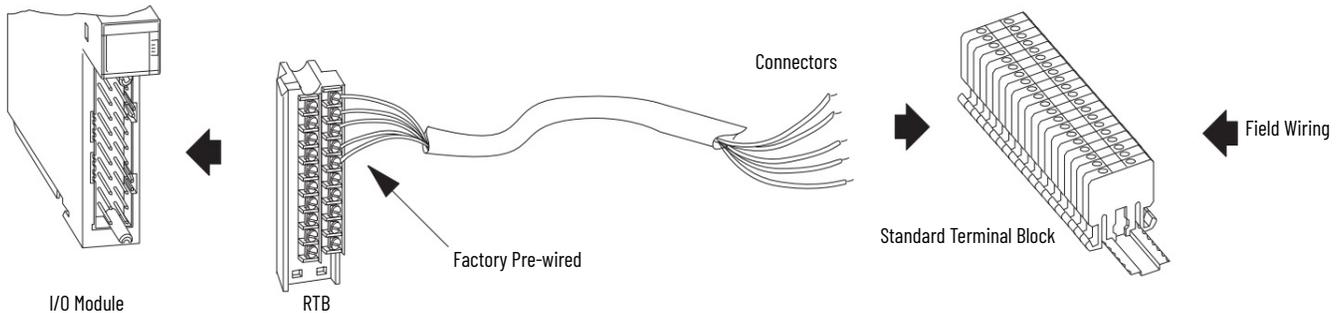

As an alternative to purchasing an RTB and connecting the wires yourself, you can purchase one of these types of wiring systems:

- Interface modules (IFMs) that provide the output terminal blocks for digital I/O modules. Use the pre-wired cables that match the I/O module to the IFM or AIFM.
- Analog interface modules (AIFMs) that provide the output terminal blocks for analog I/O modules. Use the pre-wired cables that match the I/O module to the IFM or AIFM.

- I/O module-ready cables. One end of the cable assembly is an RTB that plugs into the front of the I/O module. The other end has individually color-coded conductors that connect to a standard terminal block.
